

The Next Generation Colostrum Refractometer

Our Colostrum Refractometer is an extremely portable, easy to use instrument for analyzing the Colostrum quality from a mare. A drop or two of fresh Colostrum is required and in less than a minute, you can instantly define whether or not the foal has the ability to achieve a positive passive transfer of the mares immunoglobulin's. The Next Generation Colostrum Refractometer features automatic temperature compensation for enhanced accuracy over an operational range of 10°C - 30°C (50°F – 86°F).

Knowing the Colostrum quality of the mare, immediately post foaling, allows the broodmare manager and/or owner to determine if additional antibodies are necessary. Exodus encourages the banking of Colostrum; results from this test can verify mares that are suitable for banking Colostrum. We have a complete line of Colostrum banking supplies
